INTRODUCTION.

In the year 1906 there was published by the Meteorological Service of Canada a collection of precipitation-data, ending with the figures for the year 1902. Since that time the precipitation for the later years has been available to the public only in separate and bulky Annual Reports.

To meet the increasing demand for a publication which would contain complete precipitation-data for Canada for the last decade or more in a compact and convenient form, it was decided that those pages of the Annual Reports for the years 1902 to 1913 which presented the rainfall and snowfall records should be reprinted and bound together.

Accordingly, one will find in this book the rainfall and snowfall tabulated separately, but each year complete in itself.

Because from many letters received by the Meteorological Office in recent years it is evident that many persons do not clearly understand the method of expressing in inches the amount of precipitation, it has been thought well to append the following brief explanation.

A depth of 2.00 inches for the month of July at Toronto, for instance, means that if the total rainfall for the month had, after falling upon the country-side, remained upon the surface, as upon a huge plate without draining away or evaporating, then at the close of the month a foot-rule inserted through the water to the ground would show a depth of two inches; or a pedestrian walking across the fields would be making his way through a lake two inches deep.

Or, to explain the matter from a slightly different point of view, a rainfall of 2.00 inches for the month of July means that upon a ten-acre field there has fallen at the close of the month altogether 125,452,800 cubic inches of water, or 452,140 British imperial gallons, or 2,260 tons of water of 2,000 pounds each. To facilitate computations of this sort a table is reproduced below.

QUANTITY OF RAINFALL CORRESPONDING TO GIVEN DEPTHS.

Depth in inches.	Cubic inches per acre.	Gallons. per acre.	Tons (2,000 lbs.) per acre.
0.01.....	62,726.4	226	1.1
0.02.....	125,453	452	2.3
0.03.....	188,179	678	3.4
0.04.....	250,905	904	4.5
0.05.....	313,632	1,130	5.6

6.00.....	37,635,840	135,642	678

Depth of snow as given in the following pages is that depth to which snow at the end of the month would have accumulated if the snow falling evenly on bare ground at the beginning of the month had remained on the surface without drifting or melting, each succeeding fall accumulating without packing. Since this snow after melting is reduced to water, it is important to know its water-equivalent, that it may be added to the rainfall. Many observations throughout the Dominion have led to the rule being adopted to divide the depth of snow by 10 to find the water-equivalent. Some falls, of course, are wetter, and others dryer, but on the average this rule will give the best approximation. After division by 10 the depth of snow may be computed as cubic inches, gallons or tons by the table given above.

Under the heading "Rainfall" in the following pages, rain, hail (melted), condensed fog are included. To obtain the Total Precipitation, add to the rainfall for the month one-tenth of the snowfall.

RAINFALL in inches in each Month and for the Year 1903.
